

Process Whitelisting Without Complexity

Instant Defense Against Malware and Viruses
Highly Increased Security
Ultimate Performance

Benefits

- **Ultimate Protection**
Ensured ongoing protection against viruses, malware, targeted attacks, zero-day attacks, and other threats - known or unknown.
- **Superior Protection - All the Time**
Real-time, comprehensive process control.
- **Simplicity**
Simple to use, yet powerful technology.
- **Cloud Integration**
The Red Button Server can be offered either as a cloud service or via an on-premise installation.
- **High Performance**
Red Button will keep your organization protected without slowing down your PCs or network.
- **Enterprise Class Platform**
The design of Red Button is centered on a set of light-weight devices and clients that communicate with the central administrator driven server for the process management and threat collection.
- **Program7**
Red Button includes a 7-day self-learning mode which makes simplifies setup and configuration of company security profiles.

Real-Time Cloud Centric Process Control

Red Button is a centralized, robust process control solution that stops unwanted programs, processes, and DLLS before they are able to start.

The newest breed of PC protection and the only way to ensure enterprise wide threat protection has arrived. Prior technology left holes in your organization's security, making it easy for unwanted applications, viruses, or threats to penetrate your network. Red Button is an easy to use solution that will provide the ultimate level of protection for any organization, big or small - without the headache.

The Red Button server can be offered either as a cloud service or via an on-premise installation.

Red Button, unlike any other program on the market, is built with Program7 Technology which allows the software to automatically detect existing processes and services, making your implementation and configuration a smooth and easy process.

"Red Button is the security model of the future!"

Stu Sjouwerman, Former President and Major Shareholder, Sunbelt Software

Process Whitelisting Without Complexity

Features

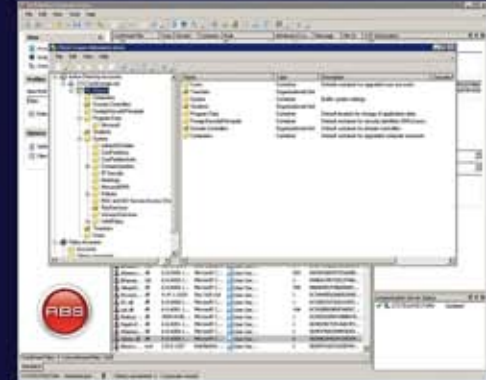

- **Real-time, Comprehensive Process Control**
- **Proactive, continuous protection via trusted Cloud based services eliminates Zero Day attacks.**
- **Active console provides visibility to every process, executable and DLL installed and running on the network.**
- **Centralized, policy driven controls of approved business applications.**
- **Network wide lockout of malware and unapproved software.**
- **Flexible Trust Configuration for End Users and Power Users.**
- **Integration with Active Directory.**
- **Set It and Forget It operation minimizes impact to IT resources.**
- **Optimized for Ring Zero initialization.**
- **Download, Install and Run the default configuration in less than 15 minutes.**
- **Subscription based pricing scales with your network.**

Red Button is a software based process inventory and control program that operates as deep in the system as possible, at the device driver level.

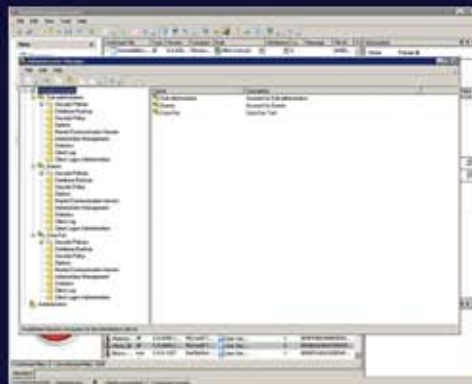

An operating system is designed to run any process once it has entered the system. This is acceptable when it comes to useful applications; however it provides total freedom for any attack that is unknown to the antivirus system. The latency gap from when new malware is created to the addition of this malware to the antivirus blacklist is a huge gap in security to organizations everyone, one that is now closed with Red Button.
